1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency's (EPA) coal combustion residual (CCR) rule (40 C.F.R. Part 257, Subpart D) and the State of Alabama's ADEM Admin. Code Chapter 335-13-15, this 2018 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document the 2018 initial assessment and two semi-annual groundwater monitoring activities at the Plant Gorgas CCR Landfill and to satisfy the requirements of §257.90(e) and ADEM Admin. Code r. 335-13-15-.06(1)(f). Initial assessment monitoring, semi-annual monitoring, and associated reporting for Plant Gorgas CCR Landfill is performed in accordance with the monitoring requirements §257.90 through §257.95 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(6).

2.0 SITE LOCATION AND DESCRIPTION

Alabama Power Company's William Crawford Gorgas Electric Generating Plant (Plant Gorgas) is located in southeastern Walker County, Alabama, approximately fifteen miles south of Jasper, at 460 Gorgas Road, Parrish, AL 35580. Based on visual inspection of USGS topographic quadrangle maps and GIS plant boundary files provided by SCS, the plant occupies portions of Sections 7, 8, 9, 16, 17, 18, 19, 20, 21, 28 and 29, Township 16 South, Range 6 West and Section 12, 13 and 24, Township 16 South, Range 7 West (USGS, 1975; USGS, 1983).

Plant Gorgas CCR Landfill is located east and northeast of the main power generation facility, respectively, and are bordered to the north by Highway 269 and to the south by the Mulberry Fork of the Black Warrior River. **Figure 1, Site Location Map**, depicts the location of the Plant and landfill with respect to the surrounding area.

3.0 SITE GEOLOGY AND HYDROGEOLOGY

3.1 Physical Setting

Plant Gorgas is in the Black Warrior River basin, an area typified by moderate relief, with river and stream valleys having dendritic drainage patterns. Elevations at the site range from approximately 260 feet above mean sea level (MSL) near the Mulberry Fork to over 500 feet MSL along a northwest trending ridge approximately 1,000 feet northwest of the plant and in upland areas on the western part of the property. Generally, near the landfill, the land surface slopes from north to south and towards the Mulberry Fork of the Warrior River.

3.2 Geology and Hydrogeology

Plant Gorgas lies in the Warrior Basin physiographic region (Sapp and Emplaincourt, 1975), a late Paleozoic basin formed as a result of flexure and sediment loading associated with Appalachian and Ouachita orogenies. The bedrock geology is dominated by clastic sedimentary rocks of the Lower Pottsville Formation as shown on **Figure 2, Geologic Map** (GSA, 2010b). Deeper stratigraphy is marked by carbonates, shales, chert, and sandstones of Mississippian to Cambrian in age (Raymond et al., 1988). Plant Gorgas is directly underlain by rocks belonging to the Pratt Coal Group (Ward II et al., 1989). In general, the Pratt Group consists of mudstone, shale, fine-grained sandstone, and interbedded coal. Strip mining was conducted over a large portion of the area down to the American Seam. As a result, the overburden beneath the disposal facilities is dominated by backfilled mine overburden and is characterized by weathered shale

and sandstone boulders with lenses of fine sediments and small amounts of coal fragments and coarse sediments. Geologic logs generated during various on-site investigations indicate that the depth to rock varies significantly, ranging from as little as five feet (un-mined areas) to as much as 155 feet below ground surface (BGS).

Two water-bearing zones are present beneath the site: (1) the mine overburden/top-of-rock interface, and (2) the underlying Pottsville Aquifer. The first saturated zone beneath the site generally corresponds to the mine overburden/top of rock interface zone at which the mine-spoil overburden transitions to bedrock (Pottsville Formation). The average depth of the first saturated zone beneath the site is approximately 107 feet BGS. The depth of the first saturated zone is generally between 105 and 115 feet BGS near the CCR landfill with an average piezometric surface rising to 18 feet above the base of the screen.

3.3 Uppermost Aquifer

The Pottsville aquifer is the uppermost aquifer beneath the site for groundwater monitoring purposes. Groundwater occurs in the Pratt Coal Group of the Lower Pottsville Formation at the site. The primary occurrences of groundwater in the uppermost aquifer are: (1) coal seams, (2) rock fractures or zones of fracture enhanced permeability, and to a lesser extent (3) bedding plains. Fractured intervals are sporadic across the site and tend to occur with greater density in the upper 100 feet of rock. Generally, groundwater yield at the site is considered low and typical of the Pottsville aquifer system. Wells were generally screened in the Pratt coal seam or across groundwater yielding fractures. Depth to groundwater producing zones were highly variable at the site and generally ranged from 30 to 240 feet BGS. Caliper, natural gamma, normal resistivity, fluid temperature, fluid resistivity logs, and heat pulse flowmeter logs were utilized to determine groundwater yielding zones. Packer testing was utilized in select borings to further enhance characterization.

Based on published data, groundwater quality produced from the Pottsville Formation can be characterized by high concentrations of sulfate, iron, and other trace metals (Jennings and Cook, 2010). Trace metals in Pottsville Formation groundwater are associated with sulfide minerals contained in organic-rich strata (e.g., Mudstones and Coal Seams) and siliceous/carbonate healed fractures and joints. Trace element enrichment is likely the result of migrating hydrothermal fluids generated during the late Paleozoic Allegheny orogeny (Diehl et al., 2004). Arsenic, antimony, molybdenum, selenium, copper, thallium, and mercury are elevated in Warrior Basin coal strata (Goldhaber et al., 2002).

4.0 GROUNDWATER MONITORING SYSTEM AND ACTIVITY

Pursuant to §257.91 and ADEM Admin. Code r. 335-13-15-.06(2), Plant Gorgas has installed a groundwater monitoring system to monitor groundwater within the uppermost aquifer. The certified groundwater monitoring system for the Plant Gorgas CCR Landfill is designed to monitor groundwater passing the waste boundary of the CCR unit within the uppermost aquifer. Wells were located to serve as upgradient and downgradient monitoring locations based on groundwater flow direction as determined by the potentiometric surface elevation contour maps. All groundwater monitoring wells were designed and constructed using “Design and Installation of Groundwater Monitoring Wells in Aquifers”, ASTM Subcommittee D18.21, as a guideline. As required by § 257.90(e) and ADEM Admin. Code r. 335-13-15-.06(1)(f), the following also describes monitoring related-activities performed during the preceding year

4.1 Groundwater Monitoring System

The groundwater monitoring network is comprised of 8 monitoring wells. Monitoring well locations are presented on **Figure 3, Monitoring Well Location Map. Table 1, Groundwater Monitoring Well Network Details**, summarizes the monitoring well construction details and design purpose for the Plant Gorgas CCR Landfill

Monitoring well locations MW-1 through MW-4 serve as upgradient locations for the CCR Landfill. Upgradient wells are screened within the same hydrostratigraphic interval as downgradient locations and are representative of background groundwater quality at the site. Monitoring well locations MW-5 through MW-8 serve as downgradient locations for the CCR Landfill..

4.2 Monitoring Well Installation and Maintenance

There was no change to the groundwater monitoring system in 2018; the network remained the same as in the 2017 (previous) reporting year. Monitoring well-related activities were limited to visual inspection of well conditions prior to sampling, recording the site conditions, and performing exterior maintenance to perform sampling under safe and clean conditions.

4.3 Assessment Monitoring

Based on results of the 2017 Annual Groundwater and Corrective Action Monitoring Report, Alabama Power initiated an assessment monitoring program on January 15, 2018. Pursuant to 40 CFR § 257.95(a) and ADEM Admin. Code r. 335-13-15-.06(6)(a), monitoring wells were sampled for all Appendix IV parameters in February 2018, within 90 days of initiating the assessment monitoring program. Pursuant to 40 CFR §257.95(d) and ADEM Admin. Code r. 335-13-15-.06(6)(d) monitoring wells were subsequently sampled for Appendix III and Appendix IV parameters in May and November 2018. The May 2018 event was conducted within 90 days of obtaining the results from the February 2018 sampling event. Samples were collected from wells in the Professional Engineer (PE)-certified monitoring systems shown on **Figure 3**. A summary of groundwater sampling events completed in 2018 is provided in **Table 2, Compliance Sampling Events Summary**.

Analytical data from the initial assessment and semi-annual monitoring events are included as **Appendix A, Groundwater Analytical Data**, in accordance with the requirements of §257.90(e)(3) and ADEM Admin. Code r. 335-13-15-.06(1)(f)3.

5.0 SAMPLING METHODOLOGY AND ANALYSIS

The following describes the methods used to conduct assessment monitoring at the Plant Gorgas CCR Landfill.

5.1 Groundwater Flow Direction, Gradient, and Velocity

Prior to each sampling event, groundwater levels were measured and recorded to the nearest 0.01 foot within a 24-hour period from the certified well network and piezometers. Groundwater levels recorded during the monitoring events are summarized in **Table 3, Groundwater Elevations Summary 2018**. Groundwater levels and top of casing elevations were used to calculate groundwater elevation and develop the potentiometric surface elevation contour map provided as **Figures 4 through 6, Potentiometric Surface Contour Map(s)**. The general direction of groundwater flow is lateral to the southeast. The groundwater flow pattern observed during the 2018 monitoring events is consistent with historic observations.

Table 3

MW-2	502.12	419.29	417.33	417.67
MW-3	525.90	418.49	416.28	416.31

MW-8	415.53	352.87	352.98	352.80

Groundwater flow rates at the site were calculated based on hydraulic gradients, hydraulic conductivity from previous slug test results, and an estimated effective porosity of the screened horizon. Slug testing provided horizontal hydraulic conductivities for the uppermost aquifer between 5.11×10^{-3} cm/sec and 2.47×10^{-4} cm/sec. The average hydraulic conductivity value used in the calculations is 2.83×10^{-3} cm/sec or 8.01 ft/day. An estimated effective porosity of 0.015 is used in the flow rate calculations. The hydraulic gradient was calculated between well pairs shown on Table 4. An effective porosity of 15% was used.

Horizontal flow velocity was calculated using the commonly-used derivative of Darcy’s Law:

$$V = \frac{K * i}{n_e}$$

Where:

- V = Groundwater flow velocity ($\frac{feet}{day}$)
- K = Average permeability of the aquifer ($\frac{feet}{day}$)
- i = Horizontal hydraulic gradient
- n_e = Effective porosity

Using this equation, groundwater flow velocities are calculated for various areas of the site and are tabulated on **Table 4**. **Table 4** presents the velocities calculated using groundwater elevation data from the sampling events in 2018.

TABLE 4. Flow Rate Calculations								
Date	K	η_e	MW-2	MW-20	Δh	L	i	v
5/21/2018	8.01	0.15	417.33	310.82	106.51	3,507	0.030	1.60
Date	K	η_e	MW-3	MW-6	Δh	L	i	v
5/21/2018	8.01	0.15	416.28	314.16	102.12	2,970	0.034	1.82
Date	K	η_e	MW-14	MW-19	Δh	L	i	v
5/21/2018	8.01	0.15	341.03	297.09	43.94	1,890	0.023	1.23

As presented on **Table 4**, groundwater flow velocity at the site ranges from approximately 1.23 feet/day to 1.82 feet/day across the Pottsville aquifer at the site. These calculated groundwater flow velocities across the site are consistent with expected velocities in the uppermost aquifer. Calculated gradients and flow rates do not consider vertical flow gradients.

5.2 Groundwater Sampling

Groundwater samples were collected in accordance with §257.93(a) and ADEM Admin. Code r. 335-13-15-.06(4)(a). All monitoring wells at Plant Gorgas are equipped with a dedicated pump. Monitoring wells were purged and sampled using low-flow sampling procedures whereby samples are collected when field

water quality parameters (pH, turbidity, conductivity, and dissolved oxygen) were measured to determine stabilization. Groundwater samples were collected when the following stabilization criteria were met:

- 0.2 standard units for pH
- 5% for specific conductance
- 0.2 Mg/L or 10% for DO > 0.5 mg/l (whichever is greater)
- Turbidity measurements less than 5 NTU
- Temperature and ORP – record only, no stabilization criteria

During purging and sampling a SmarTroll instrument was used to monitor and record field parameters. Once stabilization was achieved, samples were collected and submitted to the laboratory following standard chain-of-custody (COC) protocol.

5.3 Laboratory Analysis

Laboratory analyses was performed by the APC Environmental Laboratory (APCEL) in Calera, Alabama or Test America, Inc. (TAL), of Pensacola, Florida and St. Louis, Missouri. Both APCEL and TAL are accredited by National Environmental Laboratory Accreditation Program (NELAP) and maintain a NELAP certification for all parameters analyzed. Groundwater data and chain of custody records for the monitoring events are presented in **Appendix A**.

5.4 Quality Assurance/Quality Control

During each sampling event, quality assurance/quality control samples (QA/QC) were collected at a rate of one sample per every 10 detection samples. Equipment blanks and duplicate samples were also collected during each sampling event. QA/QC sample data was evaluated during data validation and is included in **Appendix A**.

Groundwater quality data for the most recent sampling event was validated for the most recent sampling event following guidance from the EPA Region IV Environmental Investigations Standard Operating Procedures and Quality Assurance Manual (November 2001); the EPA Region IV Data Validation Standard Operating Procedures (US EPA Region IV, September 2011); and the analytical methods. Data validation generally consisted of reviewing sample integrity, holding times, laboratory method blanks, laboratory control samples, matrix spikes/matrix spike duplicate recoveries and relative percent differences, post digestion spikes, laboratory and field duplicate RPDs, field and equipment blanks, and reporting limits.

Where appropriate, validation qualifiers and flags are applied to the data using the procedures in EPA National Functional Guidelines for Inorganic Data Review (USEPA, 2014), as guidance. Flagged data is identified in the statistical analysis reports.

6.0 STATISTICAL ANALYSIS

Statistical analysis of Appendix III and IV groundwater monitoring data was performed on samples collected from the certified groundwater monitoring network pursuant to 40 CFR §257.93 and ADEM Admin. Code r. 335-13-15-.06(4) and following the appropriate PE-certified method. The statistical method used at the site was developed by Groundwater Stats Consulting, LLC. (GSC), in accordance with 40 CFR §257.93(f) and ADEM Admin. Code r. 335-13-15-.06(4)(f) using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, March 2009, EPA 530/R-09-007 (USEPA, 2009).

6.1 Statistical Methods

The Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by USEPA regulations. Although Assessment Monitoring has been implemented, statistical evaluation of Appendix III constituents is performed to determine if constituents have returned to background conditions. Statistical analysis was performed using methods described in the PE-certified statistical analysis plan for the site.

6.1.1 Appendix III Constituents

Statistical tests used to evaluate the groundwater monitoring data consist of interwell and intrawell prediction limits combined with a 1-of-2 verification resample plan for each of the Appendix III parameters. Intrawell prediction limits combined with a 1-of-2 verification resample plan are used to evaluate boron, calcium, fluoride, sulfate and TDS; while interwell prediction limits combined with a 1-of-2 resample plan are used to evaluate chloride and pH to determine whether there has been a statistically significant increase (SSI) over background groundwater quality. Intrawell prediction limits use screened historical data within a given well to establish limits for parameters at that well. The most recent sample from the same well is compared to its respective background to identify statistically significant increases (SSIs) over background. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to identify SSIs.

A summary table of the statistical limits accompanies the prediction limits in **Appendix B, Statistical Data Evaluation**.

6.1.2 Assessment Monitoring Statistics

Parametric tolerance limits were used to calculate background limits from pooled upgradient well data for Appendix IV parameters with a target of 95% confidence and 95% coverage. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. The background limits were then used when determining the groundwater protection standard (GWPS).

As described in 40 CFR §257.95(h)(1)-(3) the GWPS is:

- (1) The maximum contaminant level established under §141.62 and 141.66 of this title (the “MCL”).
- (2) Where an MCL has not been established:
 - (i) Cobalt 6 micrograms per liter (ug/l);
 - (ii) Lead 15 ug/l;
 - (iii) Lithium 40 ug/l; and
 - (iv) Molybdenum 100 ug/l.
- (3) Background levels for constituents where the background level is higher than the MCL or rule-specified GWPS.

Existing ADEM Admin Code r. 335-13-15 includes boron as an Appendix IV assessment monitoring parameter; therefore, it is included in the statistical analysis for the site. As explained in the Preamble to the federal CCR rule, the GWPSs listed above for cobalt, lead, lithium, and molybdenum are USEPA-established “Regional Screening Levels” (RSLs) that are used where an MCL has not been established. Following the procedure used by USEPA for the federal CCR rule, the USEPA-established RSL for boron (4.0 mg/L) was used as a GWPS for statistical comparison of boron data. **Table 5, Summary of Background Levels and Groundwater Protection Standards**, summarizes the background limit established at each monitoring well and the GWPS.

Notes:

1. Where 2 numbers are present, they denote the different background levels and background-derived GWPS for each of the 2 semi-annual monitoring events in the order that they were determined.

6.2 Statistical Analysis Results

Analytical data from the 2018 semi-annual monitoring events in May and November were statistically analyzed in accordance with the PE-certified Statistical Analysis Plan (October 2017). Appendix III statistical analysis was performed to determine if constituents have returned to background levels. Appendix IV assessment monitoring parameters were evaluated to determine if concentrations statistically exceeded the established groundwater protection standard.

Based on review of the Appendix III statistical analysis presented in **Appendix B**, Appendix III constituents have not returned to background levels.

6.2.1 First Semi-Annual Groundwater Monitoring Event

Statistical analysis of Appendix IV data identified the following statistically significant levels (SSLs) over GWPS at the listed wells:

- MW-6: Lithium.

6.2.2 Second Semi-Annual Groundwater Monitoring Event

Review of the Sanitas results presented in **Appendix B** did not identify any SSLs during the second semi-annual detection monitoring event.

7.0 ALTERNATE SOURCE DEMONSTRATION

Section 257.95(g)(3)(ii) and ADEM Admin. Code r. 335-13-15-.06(6)(g)4 allows the owner or operator to demonstrate that a source other than the CCR Unit has caused an SSL and that the SSL was the result of an alternate source or resulted from errors in sampling, analysis, statistical evaluation, or natural variation in groundwater quality.

An Alternate Source Demonstration (ASD) report for SSLs identified is included as **Appendix C, Alternate Source Demonstration**. As discussed in the ASD report, the apparent SSLs are the result of the presence of mine spoils and natural groundwater chemistry variability not accounted for by site statistics. In accordance with §257.95(g)(3) and ADEM Admin. Code r. 335-13-15-.06(6)(g)4, this ASD demonstrates that the SSLs are not the result of a release from the CCR Landfill and no further action, such as implementing an assessment of corrective measures, is necessary.

8.0 MONITORING PROGRAM STATUS

In accordance with §257.94(e) and ADEM Admin. Code r. 335-13-15-.06(5)(e), APC implemented assessment monitoring in January 2018. SSIs of Appendix III and statistically significant levels (SSLs) of Appendix IV parameters were identified at the Plant Gorgas CCR Landfill during sampling events conducted in 2018. In accordance with 40 CFR §257.95(g)(3)(i) and ADEM Admin. Code r. 335-13-15-.06(6)(g)4, APC prepared an alternate source demonstration (ASD) Appendix IV constituent exceeding the GWPS. A complete ASD report is provided in **Appendix C**. In accordance with §257.95(g)(3) and ADEM Admin. Code r. 335-13-15-.06(6)(g)4(i), APC will remain in assessment monitoring and will not implement assessment of corrective measures described in §257.96 and ADEM Admin. Code r. 335-13-15-.06(7).

9.0 CONCLUSIONS AND FUTURE ACTIONS

Based on results reported in the 2017 Annual Groundwater and Corrective Action Monitoring Report, APC initiated an assessment monitoring program on January 15, 2018. Groundwater samples were subsequently collected from the certified well network and analyzed for Appendix IV parameters.

The certified compliance monitoring well network was resampled on a semi-annual basis, occurring in May and November 2018. The groundwater samples were analyzed for all Appendix III & IV parameters. The data from the semi-annual events were statistically evaluated relative to GWPS. Statistical evaluations of the May 2018 assessment monitoring data identified SSLs of Appendix IV constituents above the GWPS.

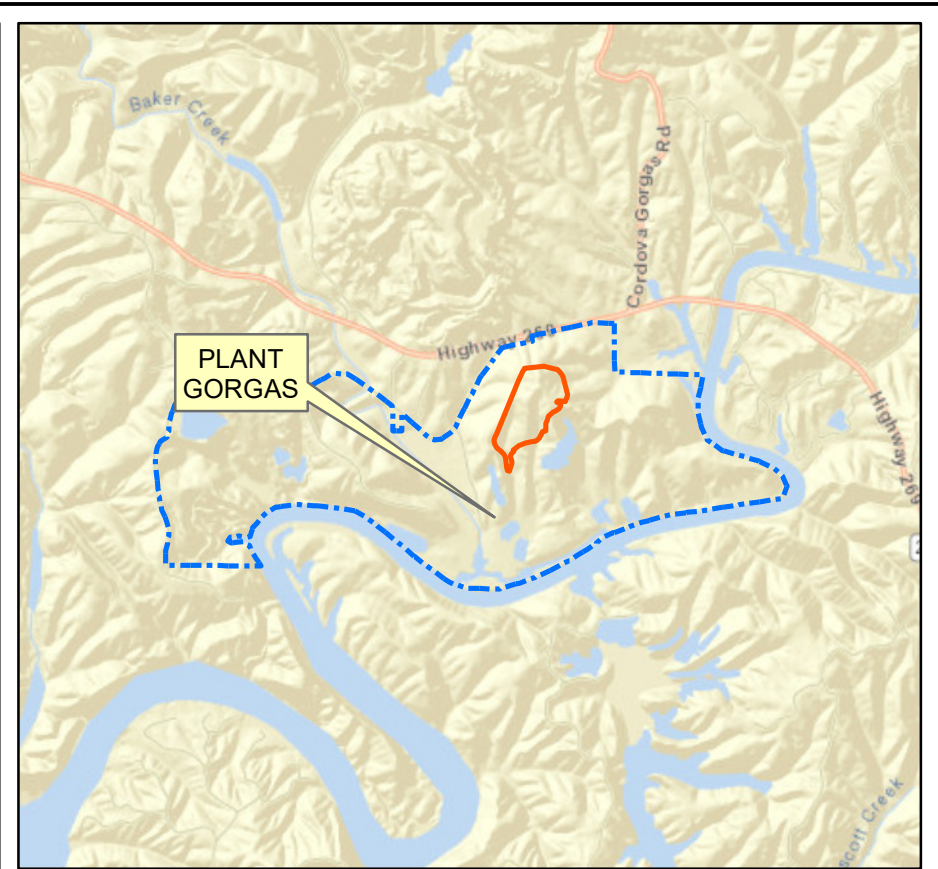

ASDs have been completed for the Appendix IV constituent exceeding the GWPS; therefore, in accordance with §257.95(g)(3)(ii) and Alabama Admin. Code r. 335-13-15-.06(6)(g)4(ii), APC will continue assessment monitoring and will not implement assessment of corrective measures described in §257.96 and ADEM Admin. Code r. 335-13-15-.06(7).

The first semi-annual assessment monitoring event is planned for April or May 2019.

Assessment Event 1

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

Light rain moved into the area while pumping and sampling well MW-15. Red flock was noticed while pumping well MW-8.

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
- Calibration verifications for all required field parameters were performed daily, before and after sample collection.

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and passed.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- All sample internal standard criteria were met.
- The high standard readbacks associated with EPA 200.7 were within acceptance criteria.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met.
 - A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.
7. All samples were analyzed at a x2.03 dilution to compensate for potential matrix effects.
 8. The raw data results include results corrected for dilution.

RAD

Method(s) 9320: Radium-228 Prep Batch 160-355865: The radium-228 detection goal was not met for the following samples due to insufficient sample available for re-analysis: AY04142 MW-13 (400-149811-17) and (MB 160-355865/4-A). Analytical results are reported with the detection limit achieved.

Method(s) PrecSep_0: Radium 228 Prep batch 160-355865: Insufficient sample volume was available to perform a sample duplicate (DUP, MS, MSD) for the following samples: AY04142 MW-13 (400-149811-17). A laboratory control sample/ laboratory control sample duplicate (LCS/LCSD) were prepared instead to demonstrate batch precision. Sample aliquot reduced due to insufficient sample volume.

Field Case Narrative

Plant Gorgas Landfill

2018 Compliance Event 1

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

Suspected iron bacteria present in MW-3 when pumping was initiated. Orange coloration diminished after further pumping.

Rain showers moved into the area when pumping and sampling well MW-5.

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
- Calibration verifications for all required field parameters were performed daily, before and after sample collection.

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and passed except for Calcium. New ICV was prepared and analyzed and all analytes passed.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- All sample internal standard criteria were met.
- The high standard readbacks associated with EPA 200.7 were within acceptance criteria.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met, with the following exception:

<u>Analyte</u>	<u>Sample ID</u>
Calcium	AY12403
Calcium	AY12413

The concentrations of the sample matrix spike/matrix spike duplicate added before digestion is less than 30 percent of the sample concentration, causing inaccurate spike recovery information. The laboratory control sample indicates that the digestion and analysis were in control.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. All samples were analyzed at a x2.03 dilution to compensate for potential matrix effects. The following samples were diluted due to analyzed sample concentration over the high standard of the calibration curve.

4. All of the above samples were analyzed by Standard Method 2540C.
5. All samples were analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch. RPD/2 was less than 5%.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- All samples were between 2.5mg and 200mg residue with the exception of AY12399, AY12407, and AY12417 which did not meet the 2.5mg residue requirement. Maximum volume of 150mL filtered.

QC	Quality Control
Rec	Recovery of Matrix Spike
RL	Reporting Limit; lowest concentration at which an analyte can be quantitatively measured.
Vio Spec	Violation Specification; regulatory limit which has been exceeded by the sample analyzed.

Qualifier	Description
B	Analyte found in reagent blank. Indicates possible reagent or background contamination.
E	Estimated reported value exceeded calibration range.
J	Reported value is an estimate because concentration is less than reporting limit.
N	Organic constituents tentatively identified. Confirmation is needed.
R	Matrix spike recovery is out of range.
U	Compound was analyzed, but not detected.
P	Precision is out of range.
C	Analyte was verified by re-analysis.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.
L	Check standard is outside of the required specification limit.
D	All samples were stored at less than or equal to 6 °C and for no longer than 48 hours from time of sampling, unless otherwise noted.
F	Water Field Group (WFG) qualifier; see comments for more information

General Chemistry

Method(s) SM 4500 Cl- E: The following sample was diluted to bring the concentration of target analytes within the calibration range: AY12435 MW-8 (400-154380-18). Elevated reporting limits (RLs) are provided.

Method(s) SM 4500 SO4 E: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for analytical batch 400849 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

Method(s) SM 4500 SO4 E: The following samples were diluted to bring the concentration of target analytes within the calibration range: AY12418 MW-13 (400-154380-1), AY12419 MW-14 (400-154380-2), AY12420 MW-14 DUP (400-154380-3), AY12421 MW-15 (400-154380-4), AY12422 MW-16 (400-154380-5), AY12425 MW-18 (400-154380-8), AY12428 MW-11 (400-154380-11), AY12432 MW-6 (400-154380-15), AY12433 MW-6 DUP (400-154380-16), AY12437 MW-4 (400-154380-20), AY12438 MW-3 (400-154380-21), AY12439 MW-12 (400-154380-22) and AY12440 MW-10 (400-154380-23). Elevated reporting limits (RLs) are provided.

Method(s) SM 4500 SO4 E: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 400865 were outside control limits. 4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- All sample internal standard criteria were met.
- The high standard readbacks associated with EPA 200.7 were within acceptance criteria.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met except for the following:
 - AY27129 and AY27306 ms/msd spike level is less than 30% of the sample nominal concentration.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. All samples were analyzed at a x2.03 dilution to compensate for potential matrix effects except for the following:

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.

- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met.
 - A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.
7. All samples were analyzed at a x5.075 dilution to compensate for potential matrix effects.

Method(s) SM 4500 F C: The sample duplicate precision for the following sample associated with analytical batch 421601 was outside control limits: (400-162459-A-9 DU). The associated Laboratory Control Sample(LCS)met acceptance criteria.

Method(s) SM 4500 Cl- E: Due to the concentration of chlorides in the parent sample the MS/MSD were diluted after the spike. The spike amount was adjusted by the dilution factor. (400-162459-A-15 MS) and (400-162459-A-15 MSD)

Method(s) SM 4500 Cl- E: The following samples were diluted to bring the concentration of target analytes within the calibration range: AY27311 MW-11 (400-162459-15), (400-162459-A-15 MS) and (400-162459-A-15 MSD). Elevated reporting limits (RLs) are provided.

Method(s) SM 4500 SO4 E: Due to the concentration of sulfates in the parent sample the MS/MSD were diluted after the spike. The spike amounts were adjusted by the dilution factor. (400-162459-A-1 MS) and (400-162459-A-1 MSD)

Method(s) SM 4500 SO4 E: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 421795 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) SM 4500 SO4 E: Due to the concentration of sulfates in the parent sample the MS/MSD were diluted after the spike. The spike amounts were adjusted by the dilution factor. (400-162459-A-14 MS) and (400-162459-A-14 MSD)

Method(s) SM 4500 SO4 E: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 422107 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) SM 4500 SO4 E: The following samples were diluted to bring the concentration of target analytes within the calibration range: AY27134 MW-10 (400-162459-1), (400-162459-A-1 MS), (400-162459-A-1 MSD), AY27135 MW-12 (400-162459-2), AY27137 MW-13 (400-162459-4), AY27138 MW-14 (400-162459-5), AY27139 MW-15 (400-162459-6), AY27140 MW-16 (400-162459-7), AY27141 MW-17R (400-162459-8), AY27142 MW-18 (400-162459-9), AY27143 MW-1 (400-162459-10), AY27144 MW-2 (400-162459-11), AY27145 MW-2 DUP (400-162459-12), AY27146 MW-3 (400-162459-13), AY27147 MW-4 (400-162459-14), AY27311 MW-11 (400-162459-15), AY27313 MW-20 (400-162459-17), AY27314 MW-19 (400-162459-18), AY27315 MW-5 (400-162459-19), AY27316 MW-6 (400-162459-20), AY27317 MW-6 DUP (400-162459-21), (400-162459-A-14 MS), (400-162459-A-14 MSD), AY27318 MW-7 (400-162459-22) and AY27319 MW-8 (400-162459-23). Qualifiers

General Chemistry

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F3	Duplicate RPD exceeds the control limit

Field Case Narrative

Plant Gorgas Landfill

ASD Event 1

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

Suspected iron bacteria present in MW-8 when pumping was initiated. Orange coloration diminished after further pumping.

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
- Calibration verifications for all required field parameters were performed daily, before and after sample collection.

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and passed.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.

- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- All sample internal standard criteria were met.
- The high standard readbacks associated with EPA 200.7 were within acceptance criteria.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met, except for the following:

<u>Analyte</u>	<u>Sample ID</u>
Calcium	AY08710
Magnesium	AY08710
Sodium	AY08710

The concentrations of the sample matrix spike/matrix spike duplicate added before digestion is less than 30 percent of the sample concentration, causing inaccurate spike recovery information. The laboratory control sample indicates that the digestion and analysis were in control.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. All samples were analyzed at a x2.03 dilution to compensate for potential matrix effects. The following samples were diluted due to analyzed sample concentration over the high standard of the calibration curve.

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.

- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met.
 - A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.
7. All samples were analyzed at a dilution of 1 to 5 to compensate for any matrix effects.
 8. The raw data results are shown with dilution factors included.

11B Analyses**Instrument Used:**

Thermal Ionization Mass Spectrometry (TIMS), TI-Box, spectromat, Germany

Standard Used:

120 ratios are taken for each sample and the average is used to calculate the delta value.

Delta values are calculated with respect to NIST SRM951a.

A secondary standard of sea water (SB1) is ran with each carousel.

Typical Standard deviation:

+/- 2 permil

1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR 21302-21501, April 17, 2015) (CCR Rule or The Rule) and ADEM Admin Code r. 335-13-15-.06(6)(g)4.(ii), this *Alternate Source Demonstration* (ASD) has been prepared to document an alternate source for for exceedances of groundwater protection standards (GWPS) at statistically significant levels (SSLs) at Alabama Power Company's Plant Gorgas CCR Landfill during assessment monitoring. This document satisfies the requirements of §257.95(g)(3)(ii) and r. 335-13-15-.06(6)(g)4.(ii), which allows the owner or operator to demonstrate that a source other than the CCR Unit has caused an SSL or that the SSL resulted from errors in sampling, analysis, statistical evaluation, or natural variation in groundwater quality.

As documented in this report, the SSL for lithium is attributed to natural groundwater chemistry related to the presence the historic mine spoils that have been reworked and become part of subsurface aquifer materials prior to the construction of the CCR Landfill unit. Therefore, the SSL for lithium is not caused by a release from the CCR unit. Based on this demonstration, no further action is required with respect to this SSL and the facility does not need to initiate an assessment of corrective measures.

2.0 SITE LOCATION AND DESCRIPTION

Plant Gorgas is an active coal-fired electric generating plant. The plant is located in southeastern Walker County, Alabama, approximately fifteen miles south of Jasper, at 460 Gorgas Road, Parrish, Alabama 35580. Coal combustion residuals (CCR) from the plant is stored at an onsite landfill – CCR Landfill (site), which is constructed with a liner system meeting the requirements of 40 CFR 257.70. The site operates under Alabama Department of Environmental Management Industrial Solid Waste Permit 64-10.

Spanning approximately 30 acres, the CCR Landfill is located northeast of the main power generation facility, and is bordered to the north by Highway 269 and to the south by the Plant Gorgas Bottom Ash Landfill. **Figure 1, Site Location Map**, depicts the location of the site referenced to roadways and geographic features.

The groundwater monitoring system for the site consists of 8 monitoring wells screened in the uppermost aquifer. **Figure 2, Site Plan Map**, shows the CCR Landfill configuration and the site monitoring well network. The well network consists of four upgradient wells (MW-1, MW-2, MW-3, and MW-4) and four wells downgradient to groundwater flow from the CCR Landfill.

3.0 SITE GEOLOGY AND HYDROGEOLOGY

3.1 Physical Setting

The CCR Landfill is situated in the Black Warrior River basin, an area typified by moderate relief, with river and stream valleys having dendritic drainage patterns. Elevations at the site range from approximately 500 feet above mean sea level (MSL) along a northwest trending ridge to approximately 260 feet MSL near the Mulberry Fork. The topographic relief near the landfill slopes from north to south and towards the Mulberry Fork of the Warrior River.

3.2 Geologic and Hydrogeologic Setting

Plant Gorgas lies in the Warrior Basin physiographic region. The bedrock geology is dominated by clastic sedimentary rocks of the Lower Pottsville Formation as shown on **Figure 3, Geologic Map** (GSA, 2010b). Plant Gorgas is directly underlain by the Pratt Coal Group (Ward II et al., 1989), consisting of mudstone, shale, fine-grained sandstone, and interbedded coal.

Historical strip mining, down to the American Seam over a large portion of the area, resulted in the removal of substantial overburden, and subsequent backfilling of overburden material beneath the Site. The mining also resulted in significant variability in the depths to rock, ranging from 5 to 115 feet below ground surface (BGS), as evident in boring logs from the site. The backfilled overburden materials overlie weathered shale and sandstone boulders with lenses of fine sediments and small amounts of coal fragments and coarse sediments.

Two water-bearing zones are present beneath the site: (1) the mine overburden/top-of-rock interface, and (2) the underlying Pottsville Aquifer. The first saturated zone beneath the site generally corresponds to the mine overburden/top of rock interface zone at which the mine-spoil overburden transitions to bedrock (Pottsville Formation). The depth of the first saturated zone is generally between 105 and 115 feet BGS near the CCR landfill. Groundwater elevations range from about 420 feet MSL in MW-3 to 305 feet MSL in MW-6, reflecting a significant change in gradient because of site topography and historical mining.

The thickness of the first saturated zone ranges between 3 and 8 feet, while the piezometric surface rises to 18 feet on average above the base of the screen. Hydraulic conductivity (K) in this zone varies widely, ranging between 10^{-1} to 10^{-4} cm/sec. Groundwater yield is low, ranging between 0.05 and 1.0 gallons per minute (gpm).

The Pottsville Formation is the uppermost aquifer beneath the site and is also the regional aquifer. Groundwater flow in the Pottsville bedrock occurs through fractures and bedding plane partings associated with fissile, siderite-banded, iron-claystone sequences. Fractured intervals are sporadic across the site and tend to occur with greater density in the upper 100 feet of rock. The upper portions of the Pottsville Aquifer beneath the Site is unconfined to semi-confined, and extremely anisotropic.

The groundwater flow direction is south and south-southeast across the Site and is governed by the site topography and subsurface geologic structures and lithofacies, including mine spoil layering. The complex lithofacies in the subsurface have developed vertical and horizontal heterogeneity of groundwater flow along permeable pathways such as coal seams and bedding plains, or along vertical or sub-vertical discontinuities in the rock fabric.

Groundwater quality in the Pottsville Formation can be characterized by high concentrations of sulfate, iron, and other trace metals (Jennings and Cook, 2010). Arsenic, antimony, molybdenum, selenium, copper, thallium, and mercury are elevated in Warrior Basin coal strata (Goldhaber et al., 2002). Trace metals in groundwater are likely associated with sulfide minerals contained in organic-rich strata (e.g., Mudstones and Coal Seams) and siliceous/carbonate healed fractures and joints. Trace element enrichment in the Pottsville Formation is likely the result of migrating hydrothermal fluids generated during the late Paleozoic Allegheny orogeny (Diehl et al., 2005). Thus, current groundwater quality would likely reflect natural groundwater interactions with the trace-element enriched rock formations and coal seams, and subsequent reworking of geologic strata in the aquifer zone.

4.0 SUMMARY OF ANALYTICAL AND STATISTICAL RESULTS

Following the detection monitoring event of October 2017, Plant Gorgas identified statistically-significant increases (SSIs) of Appendix III parameters above the upper prediction limits established based on the site-specific statistical plan. As a result, the CCR Landfill unit transitioned to assessment monitoring. Details regarding the statistical analysis are presented in the 2018 Annual Groundwater and Corrective Action Monitoring Report (SCS, 2019).

Assessment monitoring was initiated at the site on January 15, 2018. Pursuant to 40 CFR §257.95(a), the monitoring wells were sampled for all Appendix IV parameters in March as the initial assessment sampling event. In May, the first semiannual assessment monitoring event was completed by sampling monitoring wells for all Appendix III constituents and Appendix IV constituents.

The May 2018 Appendix IV data were compared to the GWPS using confidence intervals. Statistical plots presenting the confidence intervals for the site are presented in Appendix A, Statistical Analyses. Additionally, time series plots for Appendix IV groundwater quality data at the site are provided in Appendix A. For the first semi-annual assessment monitoring event, statistical analysis of Appendix IV data identified statistically significant levels (SSLs) at MW-6 for Lithium.

During the November 2018 sampling event Appendix IV data were compared to the GWPS using confidence intervals. Statistical analysis performed for the second semi-annual monitoring event (November 2018) did not identify any SSLs as the SSL for lithium from the first semi-annual event did not re-occur.

In summary, the SSL for lithium identified in the first semi-annual event in well MW-6 was not repeated during the second semi-annual event and is no longer actionable.

5.0 ALTERNATE SOURCE DEMONSTRATION

As allowed by §257.94(g)(3)(ii) and ADEM Admin Code r. 335-13-15-.06(6)(g)4.(ii), the site may demonstrate that a source other than the Plant Gorgas CCR Landfill caused the SSL for a constituent or that the SSL resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. This document includes a review of data collected since 2014 to demonstrate that the SSL for lithium at well MW-6 is due to a natural variation in groundwater quality related to the presence of mine spoils at the site and not due to a release from the CCR Landfill. A recent potentiometric surface contour map is provided for reference as **Figure 4, Plant Gorgas CCR Landfill May 2018 Potentiometric Surface Map**.

There are multiple lines of evidence supporting the conclusion that lithium occur naturally in groundwater at the site and that the SSL are not the result of a release from the CCR Landfill. The natural occurrence of lithium likely originates in coal seams and weathered mudstone bedrock at the site. This material was subsequently incorporated onto clay minerals and iron oxides during historical mining and reworking of mine spoils within the overburden material at the site. The following lines of evidence are presented in greater detail in this section:

- Lithium is observed in upgradient groundwater monitoring wells.
- Lithium is observed in groundwater monitoring wells downgradient of areas that have not yet received CCR waste.
- Lack of statistical trends for lithium in well MW-6 that shows SSL at the CCR Landfill.
- Low and stable concentrations of indicator parameters such as chloride, pH, fluoride, calcium, and total dissolved solids over time across the site.
- Similar groundwater chemistry in both upgradient and downgradient groundwater based on major ion concentrations.
- Relatively higher concentrations of strontium (up to 4 mg/L) in upgradient / background wells, indicating groundwater flow through mineralized aquifer.
- Lack of inter-relation of lithium with other metals or Appendix III parameters, except with sulfate in upgradient well MW-3.
- High concentrations of dissolved iron and manganese in wells MW-3, MW-6, and MW-20, suggesting a mechanism of lithium release into groundwater at the site.

5.1 Occurrence of Lithium in Upgradient Groundwater

Lithium occurs naturally in upgradient groundwater at concentrations ranging from 0.09 to 0.32 mg/L in well MW-3 (Figure 5). During the most recent monitoring event, the highest concentration of lithium was observed in an upgradient monitoring well. Time series plots of lithium concentrations in well MW-3 show significant fluctuations over the last two years of monitoring at the site. The fluctuations appear to be driven by recharge events resulting from high rainfall events recorded in late 2018. Due to increased concentration of lithium in upgradient well GW-3, the site-specific groundwater protection standard for lithium increased to 0.32 mg/L for the 2018 2nd semi-annual assessment event. Thus, the lithium concentration in downgradient well MW-6 is below the GWPS for the most recent sampling event conducted in November 2018 and therefore, no SSL for lithium was determined during the most recent sampling event.

The data trends reflect the natural variability of lithium in upgradient groundwater at the site. The data also suggests that lithium occurs naturally in the overburden or weathered bedrock, and its release to groundwater potentially occurs by desorption from clay minerals, iron oxides, or displaced by competing ions by recharge events. Surface-adsorbed lithium is easily displaced by more abundant cations, resulting in desorption of lithium and because of its high solubility and non-reactive nature, lithium is conservatively mobile in groundwater (EPRI, 2018).

5.2 Occurrence of Lithium Downgradient of an Empty Gypsum Landfill Area

On-site well MW-20 is not part of the Gypsum Landfill monitoring network, but provides data useful for this ASD. Well MW-20 is located downgradient of an empty Gypsum Landfill area which has never received any CCR material. Lithium concentrations in well MW-20 range from 0.253 mg/L to 0.278 mg/L which is comparable to lithium concentrations noted in downgradient well MW-6 and upgradient well MW-3 at the CCR Landfill. Occurrence of lithium concentrations at similar concentrations in groundwater of adjacent areas suggests that the SSL of lithium in groundwater is not derived from CCR material.

5.3 Occurrence and Statistical Trends of Appendix III Parameters

Boron, calcium, chloride, sulfate, fluoride, pH, and total dissolved solids (TDS) are the indicator parameters monitored at the site per the CCR Rule. Time series plots of selected indicator parameters at the site (Figure 7) indicate minor concentration variations since the start of CCR groundwater monitoring in 2016. Concentrations of boron, chloride, and calcium show minor variations that reflect seasonal variations and

local groundwater flow conditions. Increases of boron, calcium, and TDS and a decrease of pH in upgradient well MW-3 are noted in the most recent sampling event of November 2018, which corresponds to high rainfall totals recorded (6.1 inches) in the region. This increase of boron, calcium and TDS is likely due to increased recharge and removal of these constituents from the overburden in the upgradient wells. Corresponding decreases of dissolved chloride and sulfate concentrations may reflect dilution due to the increased recharge.

In the event of a release from the landfill unit, monitored indicator parameters are expected to show higher concentrations, significant variability, and significant trends. Review of Figure 8 does not show a statistically significant trend of CCR indicator parameters with time. Statistical trend tests using Sen's Slope Estimator method show no significant trends for any of the Appendix III indicator parameters. (Figure 8). An ongoing release from the CCR unit would likely result in highly variable concentrations and increasing trends – neither of these are observed. The lack of significant variability or trends suggest that these are naturally occurring constituents and that the CCR Landfill is not the source of these constituents to the groundwater at the site.

Review of data correlation supports the conclusion that the observed constituents in groundwater at the site are naturally occurring and not related to a release from the CCR unit. The groundwater data sets for each well shown in Table 2 were collected over more than two years, where seasonal conditions potentially influence geochemical conditions. Seasonal variations are noted in upgradient well MW-3, but seasonality doesn't appear to affect downgradient well MW-6. The potential that temporal shifts in lithium concentrations at these locations differ from the shifts in Appendix III indicator parameter data was evaluated by analysis of Pearson correlation coefficients (Table 2). Highly positive correlations (i.e. correlation coefficient r near 1.0) may indicate that two parameter sets are from a common influence. Conversely, non-statistically significant low correlations or negative r values indicate that the occurrence of two parameters are unrelated or even from potentially from different sources.

As shown in Table 3, lithium is not strongly correlated to any of the Appendix III parameters, except in upgradient well MW-3. Lithium shows significant positive correlation with sulfate and a significant negative correlation with pH in well MW-3. Lithium does not significantly correlate with boron in MW-3 or MW-6. Dissolution of lithium from the mine spoils or lithium-bearing coal seams in the bedrock at relatively low pH is potentially the main mechanism for the occurrence of lithium along with Fe and SO₄ in well MW-3. A lack of correlation between lithium and sulfate in well MW-6 may simply reflect a lack

of impact from recharge water at this location, likely due to its topographic location and the relatively slow travel time for groundwater flow. However, the occurrence of lithium in the mine spoils or coal seams in the subsurface ensures a stable source of lithium to groundwater at this location as noted in the time series plots (Figure 5).

Table 2. Pearson Correlation Coefficients for Lithium with Key CCR Indicators						
Well MW-3	Boron	Calcium	Chloride	Sulfate	TDS	pH
Li	0.69	0.85	-0.34	0.77	0.93	-0.90
Well MW-6	Boron	Calcium	Chloride	Sulfate	TDS	pH
Li	-0.35	-0.07	-0.57	-0.25	0.20	-0.32

5.4 Groundwater Chemistry Signature

The chemical signatures of upgradient and downgradient groundwater are similar. An impact by CCR Landfill leachate would change the chemical signature such that the downgradient chemistry signature differed from the upgradient. The downgradient chemistry signature does not show evidence of having been altered by CCR Landfill leachate.

Chemical composition of groundwater represented on a Piper Diagram (Figure 9) shows similar groundwater composition at both upgradient and downgradient site locations. Figure 9 suggests a predominantly calcium-sulfate to magnesium-sulfate groundwater at both upgradient and downgradient locations. This data reflect major-ion composition that is naturally derived from the overburden or weathered bedrock aquifer. Release of CCR constituents from the landfill would have otherwise changed the groundwater chemistry. This is not observed in the data collected to-date from the site. Rather, the groundwater composition strongly indicates major-ion concentrations derived from the mine spoils that constitute the primary aquifer material near the well screens.

The predominance of calcium and magnesium as major cations is likely related to: (1) primary deposition of the Pottsville along a marginal marine setting and (2) diagenetic carbonate-rich cements in the matrix of Pottsville rocks as well as calcite vein-filling. The Pottsville formation overlies alternating sequences of Cambrian through Mississippian limestones and dolomites. Stages of basin-wide burial, uplift, and fluid

upwelling from carbonate-rich sequences are major contributing sources of calcium and magnesium. High concentrations of sulfate are likely the result of pyrite oxidation. Disseminated pyrite was found to be widespread in claystone, shale, and individual coal seams (Figure 10). As in other coal basins, groundwater at the site is characterized by relatively high concentrations of Ca-Mg-SO₄ and lower concentrations of Na and Cl typically indicate zones proximal to recharge areas.

5.5 Occurrence of Strontium in Background Data

Strontium data collected at the site support conclusions that mine spoils and formation materials contribute elevated constituent concentrations to groundwater that are unrelated to a release from the CCR Landfill. Strontium data collected as part of the site characterization in 2013 range from 0.1 to 4.7 mg/L (Table 3). Higher strontium concentrations are noted in two wells, BG-2 and BG-5.

Generally, strontium occurs naturally in groundwater at concentrations less than 0.5 mg/L (Skougstadt and Horr, 1960); however, strontium concentrations greater than 1 mg/L are reported in some mineralized carbonate-shale aquifers of U.S. Mine spoils at the site contain significant carbonate and mudstone (shale precursor). Elevated concentrations of strontium in background groundwater at the CCR Landfill site suggests a mineralized origin of groundwater, likely from the mine spoils in the overburden or weathered marine carbonate-mudstone of the Pottsville Formation. The occurrence of groundwater strontium is most likely derived from the dissolution of celestite or strontianite in the aquifer matrix.

Well	Strontium (mg/L)			Manganese (mg/L)		
	Average	Minimum	Maximum	Average	Minimum	Maximum
BG-2	4.13	3.70	4.70	0.61	0.35	0.74
BG-3	0.64	0.63	0.64	0.34	0.33	0.34
BG-4	0.11	0.10	0.13	0.01	0.01	0.02
BG-5	2.20	0.48	3.70	0.13	0.01	0.25

5.6 High Dissolved Iron Concentrations

Dissolved iron concentrations support the conclusion that lithium is released into groundwater as a result of clay minerals and iron oxides breaking down. High concentration of dissolved iron concentrations, 24 mg/L and 38.9 mg/L respectively, are noted in upgradient well MW-3 and downgradient well MW-6. Excluding these wells, iron concentrations in other wells only ranged from <0.05 to 3.9 mg/L at the CCR Landfill. Wells MW-3 and MW-6 show the highest concentrations of lithium compared to other wells at the site. Based on limited data, it appears that lithium concentrations noted in wells MW-3 and MW-6 may be released into groundwater during breakdown of clay minerals or iron oxides at low pH and reducing conditions.

5.7 Groundwater Travel Time

Historically, baghouse waste has only been placed in the northern cell (Cell 1) of the CCR Landfill. Waste placement started the week of January 18 in 2016. The bottom elevation of the lined CCR Landfill is approximately 504 ft MSL, whereas the groundwater elevation in wells MW-6, MW-7, and MW-8 average between 306 and 352 ft MSL indicating a greater thickness of unsaturated zone in these areas. Groundwater flow rates at the site were calculated based on hydraulic gradients, hydraulic conductivity from previous slug test results, and an estimated effective porosity of the screened horizon. Slug testing provided horizontal hydraulic conductivities for the uppermost aquifer between 5.11×10^{-3} cm/sec and 2.47×10^{-4} cm/sec. The average hydraulic conductivity value used in the calculations is 2.83×10^{-3} cm/sec or 8.01 ft/day. An estimated effective porosity of 0.015 is used to determine flow rate. Average groundwater flow velocity using these parameters is 1.55 feet per day. Travel times are calculated by dividing the distance from the waste boundary in the direction of flow away from the facility to the well. Travel times assume a straight line or straight line segments. Table 4 presents travel time calculations used in this discussion.

Table 4. Travel Time Calculations						
Date	Base of Cell Elevation	GW Elevation MW-6	Δh (ft)	L (ft)	V (ft/day)	Travel Time (years)
5/21/2018	504.00	314.16	189.84	2,000	1.55	3.87

The estimated groundwater travel time from the bottom of Cell 1 to MW-6 would be approximately 3.9 years. This estimate is highly conservative because it disregards the presence of a clay liner that restricts

leachate and it assumes straight line travel between waste facility and monitoring wells. Figure 11 provides a hydrogeologic cross-section through the CCR Landfill and downgradient locations.

Calculated travel times indicate insufficient time has occurred for there to be an impact to MW-6. Therefore, it is highly unlikely that the statistical exceedance of lithium in groundwater collected from MW-6 is due to a release from the lined facility, but rather the statistical exceedance simply reflects natural occurrence and variability of lithium in groundwater at the site.

5.8 Alternate Source Summary

The most likely source of lithium in groundwater is the reworked overburden consisting of mine spoils. These mine spoils include carbonates, coal, sandstones, and organic-rich mudstones that were historically disturbed by mining. Groundwater quality in the Pottsville Formation can be characterized by high concentrations of sulfate, iron, and other trace metals (Jennings and Cook, 2010). Trace metals in groundwater are likely associated with sulfide minerals contained in organic-rich strata (e.g., Mudstones and Coal Seams) and siliceous/carbonate healed fractures and joints. Trace element enrichment in the Pottsville Formation are likely the result of migrating hydrothermal fluids generated during the late Paleozoic Allegheny orogeny (Diehl et al., 2005). Reported concentrations of lithium in coal seams of Walker County range from 2 to 214 mg/kg (Bragg et al., 1997). During mining and extraction process trace metals including lithium are incorporated into clay minerals or iron oxides and subsequently, and subsequently under favorable geochemical conditions are naturally released into groundwater.

6.0 CONCLUSION

The evaluation presented in this document demonstrates the statistically-significant levels of lithium identified in groundwater are not due to releases from the CCR unit. Rather, lithium naturally occurs in the mudstones and coal seams of the Pottsville Formation that was subsequently reworked due to historical mining operations and the mine spoils constitute the present-day overburden material at the site.

Following completion of statistical analysis of Appendix IV data from the first assessment event in May 2018, a statistically significant level above the groundwater protection standard was reported for lithium in the sample from well MW-6. Following completion of statistical analysis of Appendix IV data from the second assessment event in November 2018, no SSLs were observed. Lithium concentrations in well MW-6 were below the GWPS during the second assessment monitoring event and therefore, no SSL occurred for lithium.

Based on a review of available data, the occurrence of lithium at the CCR Landfill are due to groundwater flow through natural and reworked mine spoils in the uppermost aquifer and natural variability in groundwater flow across the different topographic setting at the site.

This ASD has been prepared in response to SSLs identified in well MW-6 during assessment monitoring. In accordance with 40 CFR § 257.95 (g)(3)(ii) and r. 335-13-15-.06(6)(g)4.(ii), this ASD demonstrates that the SSL is not the result of a release from the CCR Landfill and no further action, such as implementing an assessment of corrective measures, is necessary.
